EPIDEMIOLOGICAL COMMENTS

On November 11th, a notification was received regarding deaths in pelicans on Los Cangrejos beach, province of Paita, department of Piura. Samples were tested at SENASA's Animal Health Diagnostic Center Unit, where influenza virus type A H5 was detected. Note of 23/01/2024: Outbreak OB_124755 - 52300129 - FRUTILLO, BAMBAMARCA, HUALGAYOC, CAJAMARCA has been removed from this event as it concerns combat birds; it will therefore be included in the corresponding event (event 4765). Note of 23 February 2024: The quantitative data for the following outbreaks have been modified: ob_118326, ob_118384, ob_118391, ob_127009 and ob_112118.

AFFECTED POPULATION DESCRIPTION

The monitoring of beaches in Pisco was intensified as dead pelicans were found. On Thursday, April 11, together with SERNANP, a surveillance operation was conducted on the beaches of Laguna Grande, Chucho and Rancheria and allowed for the detection of 1 pelican with respiratory signs such as dyspnea and nervous signs. Samples were taken and sanitary burial was carried out following biosecurity procedures.

AFFECTED POPULATION DESCRIPTION

On February 20, 2023, a notification was received regarding the occurrence of mortality in backyard, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. During the inspection, 40 apparently healthy birds, 3 sick birds and 1 dead bird were found. The sick birds showed signs of weakness, prostration, cyanosis of the wattle and dyspnea, and samples of tracheal swabs and affected organs were collected, with positive results for AI type A subtype H5. Quarantine and stamping out were established and the premises were cleaned and disinfected. The owner stated that his birds began to die on 18/02, the bird that died presented weakness, head swelling and respiratory problems. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the measures imposed, so the quarantine status for avian influenza was lifted on 04.05.2023.

AFFECTED POPULATION DESCRIPTION

On February 13, 2023, a notification was received regarding the occurrence of mortality in backyard birds located in the district of Nazca, province of Nazca, department of Ica. The inspection revealed the presence of 80 apparently healthy birds, 4 sick birds and 1 dead bird. The sick birds showed incoordination of movement, prostration, weakness and hoarseness, and samples of tracheal swabs and affected organs were collected, with positive results for AI type A subtype H5. Quarantine and stamping out were established and the premises were cleaned and disinfected. The owner stated that his birds began to die on February 8th, the birds presented prostration, respiratory and nervous symptoms, there was no entry of new birds, but the owner did receive a visit from a neighbour. The birds are for self-consumption and were left roaming on the premises. The origin of the disease is attributed to contact between domestic and wild birds. The owner complied with all the measures imposed, so the quarantine status for avian influenza was lifted on 04.05.2023.

AFFECTED POPULATION DESCRIPTION

On February 11, 2023, a notification was received regarding the occurrence of mortality in a backyard flock located in the district of Ica, province of Ica, department of Ica. The inspection revealed the presence of 30 apparently healthy birds, 4 sick birds and 3 dead birds. The sick birds showed weakness, cyanosis of the wattles and head oedema. Tracheal swabs and samples of affected organs were collected, and revealed positive results for avian influenza type A subtype H5. Quarantine and stamping out were established, and the premises were cleaned and disinfected. The owner reported that his birds began to die on February 5, 2023, after a neighbour from a farm positive for avian influenza visited him with feed for his pigs (chicken viscera and feathers, collected from the collection center on Avenue Siete de Parcona); the 17 birds that died were treated with antibiotics without improvement. The birds are for self-consumption. The origin of the disease is attributed to the proximity of an avian influenza positive farm. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on May 4, 2023.

On November 22nd, during surveillance activities, a sick guanay cormorant and a dead pelican were found on Tambo de Mora Beach. The sick guanay cormorant showed torticollis, greenish diarrhea, incoordination of movement and depression; cloacal/tracheal swab samples, blood and organs were taken. The birds were culled and buried. The results of the samples were positive for avian influenza type A subtype H5. Note of 01/23/2024: The quantitative data in this outbreak have been modified to reflect new information received from the country.

AFFECTED POPULATION DESCRIPTION

On August 4, 2023, a notification was received regarding the occurrence of bird mortality in a backyard flock located in the district of Morrope, province of Lambayeque, department of Lambayeque. The inspection revealed the presence of 80 birds, 1 sick and 79 dead. The owner allowed samples to be taken, where tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected and stamping out was carried out. The owner stated that he started raising backyard birds 4 months ago. The origin of the disease is attributed to contact between domestic and wild birds. Note of 01/23/2024: The quantitative data in this outbreak have been modified to reflect new information received from the country.

AFFECTED POPULATION DESCRIPTION

On December 9, notification was received of the death of 12 guinea fowls at SERPAR's premises located in Villa El Salvador. During the inspection, 260 domestic birds and 58 wild birds in captivity were found. Of the domestic birds, 3 roosters and 1 hen were found with prostration, greenish-white diarrhea, respiratory distress and mucus, and tracheal swabs were taken. Four cockerels and other small wild birds that came into contact with the ducks and hens were observed. On December 12, the UCDSA issued positive results for avian influenza type A subtype H5. The farm was quarantined. The origin of the disease is attributed to contact between domestic and wild birds. On December 17 and 20, culling and burial of 178 and 3 domestic birds, respectively, were carried out on site, and the farm facilities were

cleaned and disinfected. Note 23/01/2024: The data related to the (domestic) birds in this outbreak have been modified to reflect new information received from the country.

AFFECTED POPULATION DESCRIPTION

On November 1, 2023, a notification was received regarding the occurrence of sick birds in a backyard flock located in the district of Huayucachi, province of Huancayo, department of Junín. During the inspection, 9 apparently healthy birds and 5 sick birds were found, the latter showing signs of weakness, mucus, conjunctivitis, and diarrhoea. Samples of tracheal and cloacal swabs were collected, and revealed positive results for avian influenza type A subtype H5. Quarantine, slaughter and sanitary burial were established, and the premises were cleaned and disinfected. The owner stated that he bought the birds on October 22, 2023 at the Cotocoto fair. The birds began to die 14 days later, and others developed respiratory problems. The birds are for self-consumption. The origin of the disease is attributed to the entry of birds infected with avian influenza. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 21.12.2023.

AFFECTED POPULATION DESCRIPTION				
On September 26, 2023, a notification was received regarding the occurrence of bird mortality in a backyard located in the district of Chalhuanca, province of Aymares, department of Aprurimac. Upon inspection, 06 birds were found to be present, 05 apparently healthy and 01 dead. The owner allowed samples to be taken, where tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected and stamped out. The owner stated that his birds had started to die a week ago, with a total of 19 birds dying to date. The origin of the disease is attributed to contact between domestic and wild birds. The owner complied with all the sanitary measures imposed, and therefore the quarantine status for avian influenza was lifted on 17.11.2023.

On September 13, 2023, a notification was received regarding the occurrence of bird mortality in a backyard flock located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. Upon inspection, 16 birds were found to be present, 13 apparently healthy and 31 dead. The owner allowed samples to be taken, where tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected and stamped out. The owner stated that since 11/09/23 his birds began to get sick, with a total of 02 birds having died to date. The origin of the disease is attributed to contact between domestic and wild birds.

AFFECTED POPULATION DESCRIPTION

On July 19, 2023, a notification was received regarding the occurrence of mortality in a backyard flock, located in the district of San Juan de Miraflores, province of Lima, department of Lima. Upon inspection, five apparently healthy birds and two sick birds were found. The sick birds presented greenish diarrhoea, swollen sinuses and mucus. Samples of tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that, 15 days prior, he bought two ducks from the Jr. Nepomuceno live bird market, which died within the first 2 days. The birds are for self-consumption. The origin of the disease is attributed to the entry of birds possibly infected with avian influenza in the farm.

AFFECTED POPULATION DESCRIPTION

On March 27, 2023, a notification was received regarding the occurrence of mortality in a backyard flock, located in the district of Puente Piedra, province of Lima, department of Lima. Upon inspection, one apparently healthy bird and one sick bird were found. The sick bird showed weakness. Tracheal swabs were collected and demonstrated positive results for avian influenza type A subtype H5. Interdiction, quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that the mortality of the birds began on March 25, the bird found dead showed weakness and lack of appetite. Additionally, on March 22, two birds entered the farm. The origin of the disease is attributed to the entry of infected domestic birds in the farm.

AFFECTED POPULATION DESCRIPTION

On August 16, 2023, a notification was received regarding the occurrence of mortality in a backyard flock located in the district of San Luis, province of Cañete, department of Lima. Upon inspection, 38 birds were found: 18 were dead, 8 were sick, and 12 were apparently healthy. The owner allowed samples to be collected (tracheal and cloacal swabs), resulting in positive results for avian influenza type A subtype H5. Quarantine was established, and the premises were cleaned, disinfected and stamped out. The owner stated that the mortality of his birds started 6 days prior, that his flock has been in contact with birds from a neighbouring flock that is positive for avian influenza, and that his dogs bring in dead wild birds. The origin of the disease is attributed to contact between domestic birds and wild birds.

AFFECTED POPULATION DESCRIPTION

On February 10, 2023, a notification was received regarding the occurrence of mortality in backyard located in the district of Eten, province of Chiclayo, department of Lambayeque. During the inspection, 35 apparently healthy birds, 2 sick birds and 1 dead bird were found. The sick birds showed incoordination of movement, greenish diarrhea and opisthotomes, and tracheal swab samples were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected. The owner stated that his birds began to die on February 8, 2002, and on February 3, 2002, he bought turkeys from Lambayeque and put them together with his other birds. The origin of the disease is attributed to the entry of possibly infected domestic birds on his farm.

AFFECTED POPULATION DESCRIPTION

On February 4, 2023, a notification was received regarding the occurrence of mortality in backyard flock located in the district of Pimentel, province of Chiclayo, department of Lambayeque. During the inspection, 22 healthy birds and 2 sick birds were found. The sick birds showed prostration, drooping wings and cyanosis of the wattle, and tracheal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected. The owner stated that his birds began to get sick and die since February 1st. The birds that died (10) showed prostration, drooping wings and cyanosis. The birds are for self-consumption. The origin of the disease is attributed to the proximity of an avian influenza positive premises.

AFFECTED POPULATION DESCRIPTION

On August 10, 2023, a notification was received regarding the occurrence of mortality in a backyard flock located in the district of Acobamba, province of Tarma, department of Junín. Upon inspection, 55 birds were found to be present, 35 apparently healthy, 15 sick and 5 dead. The owner allowed samples to be taken, where tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected and stamped out. The owner stated that the birds began to get sick 15 days ago, with one or two birds dying per day. He treated the birds with various drugs and, as no results were obtained, he notified SENASA through a neighbor.

AFFECTED POPULATION DESCRIPTION

On July 6, 2023, a notification was received regarding the occurrence of mortality in a backyard flock, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. Upon inspection, eight apparently healthy birds and two birds with clinical signs consistent with avian influenza were found to be present, with mucus, cyanosis of the wattle, weakness, and diarrhoea. The owner allowed samples to be taken (tracheal and cloacal swabs were collected), that showed positive results for AI type A subtype H5. Quarantine was established, and the premises were cleaned and disinfected. The owner stated that on June 30, 23 dead birds were tossed near his home, and that on July 3, 2023, three of his birds died. The origin of the disease is attributed to contact between domestic birds and wild birds. The owner complied with all the control measures imposed, and therefore the quarantine status for avian influenza was lifted on July 21, 2023.

AFFECTED POPULATION DESCRIPTION

On July 21, 2023, a notification was received regarding the occurrence of mortality in a backyard flock, located in the district of San Juan de Miraflores, province of Lima, department of Lima. During the inspection, 86 apparently healthy birds, 2 sick birds and 1 dead bird were found. The sick birds showed drooping, mucus, torticollis and greenish diarrhea. Samples of tracheal and cloacal swabs and affected organs were collected, with positive results for AI type A subtype H5. Quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that 7 days ago, he received 13 chickens from his friend's farm and 2 days ago the mortality of his birds began. The birds are for self-consumption. The origin of the disease is attributed to the entry of birds infected with avian influenza.

AFFECTED POPULATION DESCRIPTION

On July 11, 2023, a notification was received regarding the occurrence of mortality in a backyard located in the district of La Tinguíña, province of Ica, department of Ica. Upon inspection, 70 apparently healthy birds were found, 01 dead bird and 12 birds with clinical signs compatible with avian influenza, showing weakness and hoarseness. The owner allowed samples to be taken, where tracheal swabs were collected and organs and tissues were necropsied, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected and stamping out was applied. The owner stated that his birds started to get sick since 06/27/23, he treated them and today he found a dead bird. He reports that approximately 20 days ago he bought birds from the Tumbes market in downtown Ica. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the control measures imposed, therefore the quarantine status for avian influenza was lifted on 26.09.2023.

AFFECTED POPULATION DESCRIPTION

On March 11, 2023, a notification was received regarding the occurrence of bird mortality in backyard flocks, located in the district of Talavera, province of Andahuaylas, department of Andahuaylas. The inspection revealed the presence of 8 apparently healthy birds, 2 sick birds and 10 dead birds. The sick birds showed rales and edema of the head, crest and wattles, and samples of tracheal swabs and affected organs were collected, with positive results for AI type A subtype H5. Interdiction, quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that his birds began to die on March 9, 2003 with head swelling, rales, crest cyanosis and some of them died suddenly. There were no birds entering or leaving the premises. The origin of the disease is attributed to the proximity of positive premises. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 12.05.2023.

AFFECTED POPULATION DESCRIPTION

On February 27, 2023, a notification was received regarding the occurrence of bird mortality in a backyard flock located in the district of San Jeronimo, province of Andahuaylas, department of Apurimac. During the inspection, 3 apparently healthy birds and 1 dead bird were found. The dead bird showed dehydration and samples of affected organs were collected and tested positive for AI type A subtype H5. Quarantine and stamping out were established, and the premises were cleaned and disinfected. The owner stated that his birds began to die on February 25. The dead birds presented hoarseness, ruffled feathers, crest edema and white diarrhea. The origin of the disease is attributed to the virus entering the premises through fomites (personnel clothing). The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on April 27, 2023.

AFFECTED POPULATION DESCRIPTION

On December 09, 2022, a notification was received regarding the occurrence of a sick backyard bird. Upon inspection, 55 birds were found to be present (02 roosters, 08 hens, 04 turkeys, 22 chicks and 19 ducks), one of the roosters showed weakness, conjunctivitis, nasal discharge and greenish diarrhea, and a tracheal swab sample was collected. On 11/12, the SENASA laboratory confirmed that the samples submitted were positive for Influenza type A subtype H5. The birds are self-consumed. The origin of the disease is attributed to contact between domestic and wild birds.

AFFECTED POPULATION DESCRIPTION

On April 14, 2023, during perifocal surveillance activities, a backyard with recent mortality was visited in the district of Catacaos, province of Piura, department of Piura. During the inspection, 9 apparently healthy birds were found, and cloacal swab samples were collected, with positive results for AI type A subtype H5. The premises were placed under interdiction and during the next visit the birds were found to have died, so they were buried, the premises were cleaned and disinfected and quarantined. The owner stated that his birds began to die on March 14; the birds that died (16) had diarrhea, cyanosis and sudden death. The birds are self-consumed. The origin of the disease is attributed to the proximity to a positive farm. The owner complied with the sanitary measures and the quarantine was lifted on 16.06.2023.

AFFECTED POPULATION DESCRIPTION

On April 10, 2023, during perifocal surveillance activities, a notification was received regarding the presence of sick birds in a backyard flock located in the district of Catacaos, province of Piura, department of Piura. The inspection revealed the presence of 54 apparently healthy birds and 1 sick bird, which showed weakness and cyanosis. Tracheal and cloacal swab samples were collected and tested positive for AI type A subtype H5. Quarantine, stamping out of the sick birds and burial were established, and the premises were cleaned and disinfected. The owner stated that his birds began to die on April 7; the birds that died showed cyanosis. The birds are self-consumed. The origin of the

disease is attributed to the proximity to an avian influenza positive farm. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 16.06.2023.

AFFECTED POPULATION DESCRIPTION

On May 3, 2023, during surveillance activities in the perifocal area of a previous outbreak, a premises with dead birds (02 birds) was detected, located in the district of Morrope, province of Lambayeque, department of Lambayeque. Upon inspection, 1 dead bird was found to be present, showing signs of prostration, cyanosis, diarrhea and torticollis. Tracheal swab samples were collected and tested positive for AI type A subtype H5. Interdiction, quarantine, cleaning and disinfection of the premises, stamping out and burial were established. The owner stated that his birds began to get sick and die since April 27 with signs compatible with avian influenza. The origin of the disease is attributed to the proximity to a positive premises, since it was detected during surveillance in the perifocal zone of a previous outbreak.

AFFECTED POPULATION DESCRIPTION

On March 30, 2023, a notification was received regarding the occurrence of mortality in backyard located in the district of Morrope, province of Lambayeque, department of Lambayeque. On inspection, 20 apparently healthy birds were present, and three sick birds were found with weakness, drooping wings, mucus and whitish diarrhea. Tracheal swab samples were collected and tested positive for avian influenza type A subtype H5. Quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that his birds began to get sick and die since March 18, 2023. The birds that died showed mucous secretion, incoordination of movements and whitish diarrhoea. The birds are raised for self-consumption. The origin of the disease is attributed to the contact of domestic birds with wild birds.

AFFECTED POPULATION DESCRIPTION

On January 30, 2023, a notification was received regarding the occurrence of mortality in a backyard flock located in the district of Pimentel, province of Chiclayo, department of Lambayeque. Upon inspection, 27 healthy birds, 04 dead birds and 06 sick birds with diarrhea, prostration and fever were found. The owner allowed a sample to be taken and tracheal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected and stamping out was applied. The owner stated that on January 26, 2001, the death of his birds began, for which palliative treatment was provided for the signs without favorable results. He also indicates that his birds have contact with birds from other premises that have been diagnosed with AI and with wildlife. The origin of the disease is attributed to the proximity to a positive farm and the contact of domestic birds with wild birds.

AFFECTED POPULATION DESCRIPTION

On July 3, 2023, a notification was received regarding the occurrence of mortality in backyard birds located in the district of Pueblo Nuevo, province of Ica, department of Ica. Upon inspection, 24 apparently healthy birds were found, 09 dead birds and 05 birds with clinical signs

compatible with avian influenza, showing torticollis, ocular secretion, congestion and weakness. The owner allowed a necropsy to be performed on one of the birds and samples were taken, where tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned, disinfected, culled and buried. The owner stated that since 6/29/23 his birds started showing respiratory signs and to date 21 birds have died. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, and therefore the quarantine status for avian influenza was lifted on September 26, 2023.

AFFECTED POPULATION DESCRIPTION						
On April 19, 2023, a notification was received regarding the occurrence of bird mortality in a backyard flock, located in the district of Pisco, province of Pisco, department of Ica. Upon inspection, 57 apparently healthy birds and 5 sick birds were found to be present, showing ocular secretion, weakness, cyanosis, mucus, dyspnea and hoarseness. Samples of tracheal swabs and affected organs/tissues were collected, with positive results for AI type A subtype H5. Quarantine, stamping out of the sick birds and burial were established, and the premises were cleaned and disinfected. The owner stated that his birds began to die on April 16; the birds that died (14) presented nasal and ocular secretion, cyanotic head and weakness. The birds are self-consumed. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 10.08.2023.

AFFECTED POPULATION DESCRIPTION

On February 8, 2023, a notification was received regarding the occurrence of bird mortality in a backyard , located in the district of Namora, province of Cajamarca, department of Cajamarca. The inspection revealed the presence of 42 apparently healthy birds and 2 dead birds. No lesions were observed during the necropsy of the dead bird, and tracheal and cloacal swab samples were collected, with positive results for AI type A subtype H5. Quarantine and stamping out were established and the premises were cleaned and disinfected. The owner stated that his birds suddenly started to die the day before and 15 days ago he observed the death of pigeons in the field. The birds are self-consumed. The origin of the disease is attributed to contact between domestic and wild birds. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 12.04.2023.

AFFECTED POPULATION DESCRIPTION

On August 1, 2023, a notification was received regarding the occurrence of mortality in backyard located in the district of Los Baños del Inca, province of Cajamarca, department of Cajamarca. Upon inspection, 20 apparently healthy birds and 10 birds with clinical signs compatible with avian influenza were found to be present, showing ocular secretion, mucus, drooping and snoring. The owner allowed sampling and tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected. The birds were culled and buried in a sanitary manner. The owner stated that from 28/07/23 to 31/07/23, 04 birds had died (01 per day), and that on Wednesday 26/07/23, all the birds raised by his sister, who lives on the property adjacent to his property, died. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, and therefore the quarantine status for avian influenza was lifted on 12.09.2023.

AFFECTED POPULATION DESCRIPTION

On July 26, 2023, a notification was received regarding the occurrence of mortality in backyard located in the district of Los Baños del Inca, province of Cajamarca, department of Cajamarca. Upon inspection, 16 apparently healthy birds and 04 birds with clinical signs compatible with avian influenza were found to have mucus, drooping and diarrhea. The owner allowed a sample to be taken and tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected. The owner stated that on July 14, 23 he flood irrigated his house where he raised birds and that from that moment on, his birds began to get sick and die, resulting in 25 dead birds, so on July 23, 23 he decided to move the birds that were still alive to the current premises where the inspection was carried out. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 11.09.2023.

AFFECTED POPULATION DESCRIPTION

On January 13, 2023, a notification was received regarding the occurrence of bird mortality in a backyard, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. Upon inspection, 10 healthy birds, 02 sick birds and 02 dead birds were found. The sick birds showed signs of weakness, anorexia and congestion. The owner allowed sampling and tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the premises were cleaned and disinfected. The owner stated that on January 2, 2001, two birds from a premises where 16 ducks and 02 chickens had died without notification entered his premises. The origin of the disease is attributed to contact between domestic birds and wild birds. The owner complied with all the control measures imposed, so the quarantine status for avian influenza was lifted on 02.03.2023.

AFFECTED POPULATION DESCRIPTION

On April 4, 2023, a notification was received regarding the occurrence of mortality in a backyard flock located in the district of Hualgayoc, province of Hualgayoc, department of Cajamarca. Upon inspection, three healthy birds, 40 dead birds and two sick birds were found with anorexia, drooping wings, fever, whitish diarrhoea, weakness, cyanosis of the wattle and oedema in the head, comb and wattle. The owner allowed sampling (tracheal swabs were collected) revealing positive results for AI type A subtype H5. Quarantine was established, the premises were cleaned and disinfected, and stamping out and burial applied. The owner stated that since March 28, 2023, his birds began to die; 40 dead birds are currently dead (rapid death), and presented fever, white diarrhoea, isolation from the group, swollen head and had stopped eating. He also reports that on March 19, 2023, he bought three birds at a nearby local market. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the control measures imposed, so the quarantine status for avian influenza was lifted on June 5, 2023.

AFFECTED POPULATION DESCRIPTION

On April 4, 2023, a notification was received regarding the occurrence of mortality in a backyard located in the district of Bagua, province of Bagua, department of Amazonas. Upon inspection, 21 apparently healthy birds and 03 sick birds were found to be present, showing anorexia, bloody oral discharge, whitish diarrhea, weakness, eye discharge and coughing. Tracheal swab samples were collected and tested positive for AI type A subtype H5. Quarantine, stamping out and burial were established, and the premises were cleaned and disinfected. The owner stated that he bought birds from Chiclayo and his birds began to get sick and die on April 2, 2004. The birds that died showed signs of weakness, anorexia, and nasal and ocular discharge. The birds are self-consumed. The origin of the disease is attributed to the entry of possibly infected domestic birds into his premises . The owner complied with all the control measures imposed, so the quarantine

status for avian influenza was lifted on 19.06.2023.

AFFECTED POPULATION DESCRIPTION

On February 22, 2023, a notification was received regarding the occurrence of mortality in a backyard located in the district of San Clemente, province of Pisco, department of Ica. During the inspection, 73 apparently healthy birds and 3 sick birds were found to be present. The sick birds showed weakness, depression, conjunctivitis, edema of the head, comb and wattles, and samples of tracheal swabs and affected organs were collected, with positive results for AI type A subtype H5. Quarantine and stamping out were established and the premises were cleaned and disinfected. The owner stated that his birds began to die on 02/18, the 18 birds that died were the same as those described during the inspection. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the measures imposed, so the quarantine status for avian influenza was lifted on 05.06.2023.

AFFECTED POPULATION DESCRIPTION

On February 9, 2023, a notification was received regarding the occurrence of bird mortality in backyard flocks, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. During the inspection, 1 apparently healthy bird, 1 sick bird and 7 dead birds were found. During the necropsy of the dead birds, ecchymosis was observed and samples of tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine and burial were established and the premises were cleaned and disinfected. The owner stated that his birds suddenly started to die two days ago and 15 days ago he received 1 hen and 3 chicks from his neighbor, which subsequently died. The birds are for self-consumption. The origin of the disease is attributed to the entry of possibly infected domestic fowl onto his premises. The owner complied with all the measures imposed, so the quarantine status for avian influenza was lifted on 12.04.2023.

AFFECTED POPULATION DESCRIPTION

On February 6, 2023, a notification was received regarding the occurrence of mortality in backyard, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. During the inspection, 17 healthy birds and 5 sick birds were found to be present. The sick birds showed signs of weakness, anorexia, hoarseness and fever, and tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. Quarantine and stamping out were established and the premises was cleaned and disinfected. The owner stated that his birds began to get sick and die since February 4, 2002, of which 5 died suddenly, there was no entry of new birds. The birds are for self-consumption. The origin of the disease is attributed to the proximity of an avian influenza positive premises. The owner complied with all the measures imposed, so the quarantine status for avian influenza was lifted on 30.03.2023.

AFFECTED POPULATION DESCRIPTION

On January 26, 2023, a notification was received regarding the occurrence of mortality in backyard , located in the district of Celendin, province of Celendin, department of Cajamarca. Upon inspection, 04 healthy birds, 01 dead bird and 02 sick birds with whitish diarrhea and cyanosis were found. The owner allowed a sample to be taken and tracheal swabs were collected, with positive results for AI type A subtype H5. Quarantine was established and the farm was cleaned, disinfected and stamped out. The owner stated that on January 22 he acquired backyard birds of unknown origin, that on January 23 the birds presented white diarrhea, cyanotic face and antibiotic therapy was applied, improving the diarrhea, and that on January 26 he had the first sudden death. The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 15.03.2023.

AFFECTED POPULATION DESCRIPTION

On January 26, 2023, a notification was received regarding the occurrence of bird mortality in a backyard flock, located in the district of Cajamarca, province of Cajamarca, department of Cajamarca. Upon inspection, 05 apparently healthy birds, 07 dead birds and 03 sick birds

with edema on the head, crest and wattles were found, and the owner allowed a sample to be taken and tracheal and cloacal swabs were collected, with positive results for AI type A subtype H5. The premises were placed under interdiction, quarantine, and the premises were cleaned and disinfected, ending in stamping out. The owner stated that the birds are from his own breeding, but that they have contact with wild birds (geese, pigeons, etc.). The origin of the disease is attributed to the contact of domestic birds with wild birds. The owner complied with all the sanitary measures imposed, so the quarantine status for avian influenza was lifted on 16.03.2023.

AFFECTED POPULATION DESCRIPTION

On January 3, 2022, a notification was received regarding the occurrence of bird mortality in a backyard located in the town of Chilipampa Bajo. During the inspection, the presence of 09 healthy birds and 03 dead birds were found, which presented decay, hoarseness, sneezing, sudden death, hemorrhage, hepatomegaly, congestion and obstruction, and organ samples and tracheal/cloacal swabs were collected. The owner stated that before Christmas (23/12/2023), 10 birds had died with sneezing, decay and sudden death. On 09/01/23, the SENASA laboratory confirmed that the samples submitted were positive for Avian Influenza type A subtype H5. The farm was quarantined and on January 7 and 9 the stamping out of 6 and 3 birds respectively was carried out, burying them on the farm and proceeding to clean and disinfect the farm. The birds are for self-consumption. The origin of the disease is attributed to contact between domestic and wild birds. The owner complied with the sanitary measures and the quarantine was lifted on 28.02.2023.

AFFECTED POPULATION DESCRIPTION

On June 1, during surveillance activities on the coast, dead and sick guanayes, Peruvian boobies and chuitas cormorants were found at El Carmen beach, located in the district of El Carmen, province of Chincha, department of Ica. The birds showed signs of torticollis, weakness, decay and incoordination in movement, and tracheal swabs and organ samples were taken only from the sick birds (boobies and Chuita cormorants), as the dead birds were in a state of decomposition. The results were positive for Avian Influenza Type A subtype H5. The birds were buried on site.

On December 13, 2022, a notification was received regarding the occurrence of mortality in backyard located in the district of Supe, province of Barranca, department of Lima. Upon inspection, 03 sick birds were found to be present, showing signs of respiratory distress, decay and starvation. Tracheal swab samples were collected and tested positive for AI type A subtype H5. The farm was quarantined. The birds were culled and buried on the same premises, and the premises were cleaned and disinfected. The owner stated that his birds started to get sick and die since 10/12, the birds that died had diarrhea and swollen heads. He indicates that 15 days ago he bought 3 chickens from the market. The birds are for self-consumption. The origin of the disease is attributed to the contact of domestic birds with wild birds. The establishment complied with the sanitary measures and the quarantine was lifted on 12.05.2023.

AFFECTED POPULATION DESCRIPTION

On November 30, 2022, a notification was received regarding the occurrence of bird mortality in a backyard farm located in the town of Poruma. Upon inspection, 9 dead birds and 6 sick birds (05 turkeys and 01 hen) were found to be weak, and samples of organs and swabs of the sick birds were collected. The producer stated that since November 26 his birds began to become depressed and the next day they died circling around. The dead birds were buried and the farm was placed under interdiction. On 01/12, SENASA's UCDSA confirmed that the samples submitted were positive for Avian Influenza type A subtype H5. The origin of the disease is attributed to the contact of domestic birds with wild birds. On December 2, 2022, 100 birds of different ages (hens, roosters, 05 chickens, turkeys, ducks, geese) were culled in the outbreak. The final disposal of the carcasses by means of sanitary burial was carried out on the same premises. The pens and all the farm facilities were immediately cleaned and disinfected. Likewise, as a sanitary measure, the stamping out of 200 birds from two neighboring farms whose birds were in contact with the birds in the outbreak was ordered. All the birds were for self-consumption. Quarantine was established in the outbreak and epidemiological surveillance was carried out in the perifocal zone (5 km) in a total of 82 backyard farms, with a total population of 3,764 birds, all of which had no symptoms of AI, and 133 serum samples were taken.

AFFECTED POPULATION DESCRIPTION

On December 12, 2023, a notification was received about wild birds in captivity with symptoms of diarrhoea, stunning, lack of appetite and

weakness at Las Rocas Zoo, located in the district of Marcara, province of Carhuaz, department of Ancash. The owner states that one harrier, two owls and one peacock died between from 10 to 12 December, 2023. During the inspection, on 13 December, 2023, 16 domestic birds and 17 wild birds in captivity were found healthy, two harriers and one condors were sick, and one owl was found dead, showing greenish diarrhoea and weakness. Tracheal swabs and tissue samples were taken to be sent to the laboratory, that revealed positive results for avian influenza type A subtype H5. The zoo was quarantined and the domestic birds were culled on December 19. The origin of the disease is attributed to the contact of domestic captive wild birds fed with meat from infected birds. The outbreak is closed with the date of the quarantine report of the zoo.

AFFECTED POPULATION DESCRIPTION

On November 19, 2022, a notification was received about the occurrence of mortality of birds in a backyard, located in the town of Caleta Vidal, in the upper part, upon inspection it was found the presence of 8 hens, 01 rooster and 18 ducks, of which 2 birds were sick (01 rooster and 01 hen), which showed weakness, cyanotic crest and greenish white diarrhea, collecting tracheal swabs samples of the sick birds. The producer stated that since 15/12 his birds (hens) began to die with signs of diarrhea and weakness. Disinfection and interdiction of the premises were carried out. On 22/12, SENASA's UCDSA confirmed that the samples submitted were positive for Avian Influenza type A subtype H5. The farm was quarantined. The origin of the disease is attributed to contact between domestic and wild birds. All the birds were for self-consumption.
